Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException AtTheRateException DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com

Output: Valid email address

Answer

```
// You are using Java
import java.util.Scanner;
```

```
// Custom Exceptions
```

```
class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}
```

```
class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}
```

```
class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}
```

```
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine();

        try {
            validateEmail(email);
            System.out.println("Valid email address");
        } catch (DotException e) {
            System.out.println("DotException: " + e.getMessage());
        }
    }
}
```

```

        System.out.println("Invalid email address");
    } catch (AtTheRateException e) {
        System.out.println("AtTheRateException: " + e.getMessage());
        System.out.println("Invalid email address");
    } catch (DomainException e) {
        System.out.println("DomainException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
}

```

```

public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {

```

```

    if (email.startsWith(".") || email.endsWith(".") || email.contains("..")) {
        throw new DotException("Invalid Dot usage");
    }

```

```

    if (email.startsWith("@") || email.endsWith("@") || email.contains("@@")) {
        throw new AtTheRateException("Invalid @ usage");
    }

```

```

    int atCount = 0;
    for (char ch : email.toCharArray()) {
        if (ch == '@') {
            atCount++;
        }
    }

```

```

    if (atCount != 1) {
        throw new AtTheRateException("Invalid @ usage");
    }

```

```

    String[] parts = email.split("@");
    if (parts.length != 2) {
        throw new AtTheRateException("Invalid @ usage");
    }

```

```

    String afterAt = parts[1];
    if (!afterAt.contains(".")) {
        throw new DotException("Invalid Dot usage");
    }

```

```

    int lastDotIndex = email.lastIndexOf('.');
    String domain = email.substring(lastDotIndex + 1);

```

```
        if (!(domain.equals("com") || domain.equals("in") || domain.equals("net") ||  
        domain.equals("biz"))) {  
            throw new DomainException("Invalid Domain");  
        }  
    }  
}
```

Section 1 : Coding

1. Problem Statement

Elsa, a busy professional, is using a scheduling application to plan her meetings efficiently. The application requires users to input meeting durations in minutes, ensuring that the duration is a positive integer and does not exceed 240 minutes (4 hours). Elsa needs a program to assist her in scheduling meetings securely with proper exception handling.

Create a Java class named ElsaMeetingScheduler. Implement a custom exception: InvalidDurationException for invalid meeting duration entries. Implement the main method to interactively take user input for a meeting duration. Implement the validateMeetingDuration method to validate the meeting duration based on the specified rules and throw a custom exception if the validation fails. Print appropriate success or error messages based on the meeting duration.

Implement a custom exception, `InvalidDurationException`, to handle cases where the entered meeting duration does not meet the specified criteria.

Input Format

The input consists of an integer value 'n', representing the meeting duration.

Output Format

The output is displayed in the following format:

If the entered meeting duration meets the specified criteria, the program outputs

"Meeting scheduled successfully!"

If the entered meeting duration is invalid, the program outputs an error message indicating the issue.

"Error: Invalid meeting duration. Please enter a positive integer not exceeding 240 minutes (4 hours)."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 120

Output: Meeting scheduled successfully!

Answer

```
import java.util.Scanner;
```

```
// Custom Exception Class
```

```
class InvalidDurationException extends Exception {  
    public InvalidDurationException(String message) {  
        super(message);  
    }  
}
```

```
// Main Class (renamed to match Main.java)
```

```
public class Main {
```

```
// Method to validate meeting duration
public static void validateMeetingDuration(int n) throws
InvalidDurationException {
    if (n <= 0 || n > 240) {
        throw new InvalidDurationException("Invalid meeting duration");
    }
}

// Main Method
public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    int n = sc.nextInt();
    sc.close();

    try {
        validateMeetingDuration(n);
        System.out.println("Meeting scheduled successfully!");
    } catch (InvalidDurationException e) {
        System.out.println("Error: Invalid meeting duration. Please enter a positive
integer not exceeding 240 minutes (4 hours).");
    }
}
}
```
